

Introduction to SN25

August, 2026

UR enters Bittensor with a P2P privacy network that already exists today with mass distribution

350K+

Monthly Active Users

Demand

100K+

Network Providers

Supply

100+

Countries, 3K cities

Coverage

\$0

CAC

Distribution

UR.io has the supply side, demand side and payout loop that most subnets spend years trying to create

- Live consumer distribution across **iOS, Android, macOS, and browser extension**
 - **Windows** and **Linux** coming very soon
- The network creates a **cash-incentivised supply base**, paying contributors for bandwidth
- The **subnet turns routing capacity into a market** scored by reliability, geography, uptime and real traffic served

Big Internet centralises the path; open networks distribute it

BIG INTERNET

UR INTERNET

SUPPLY

Finite data centre fleets

Residential capacity from independent operators

CONTROL

One company controls the path

Routes distributed across a broader supply base

FAILURE SURFACE

Known infrastructure can be enumerated or blocked

No single fixed fleet defines the entire target

ECONOMICS

Margin accrues to the platform

Useful reachability can be measured and rewarded

P2P encryption network is unlocking new research paths

LIVE PRODUCT

ur.io

350K+ monthly actives

Live usage creates network demand.

CURRENT RESEARCH

Project Bastion

How do we unlock enterprise network connectivity?

Project Stargate

Can one open index support model training and live retrieval?

Project Meridian

How do we create dedicated identity for agents?

UR SUBNET

Shared provider + validation layer

One infrastructure supports live demand and all three research programmes through quality scoring and an incentive market

100K+

residential providers

100+

countries

Validators measure performance before emissions reach miner UIDs

UR will create an ecosystem of network operators

NETWORK OPERATORS

LIVE TODAY

- **ur.io** consumer VPN · 350K+ MAU

UR RESEARCH PIPELINE

- **Project Bastion** enterprise access
- **Project Stargate** open web index
- **Project Meridian** corporate mesh

AREAS OF INTEREST

- A competing VPN
- An agent-infra startup
- A data business
- Something not yet imagined

UR (SN25)

one settlement layer

billed on MAU × GB/day · paid in alpha

WHERE THE VALUE LANDS

01

Operators use SN25

Network operators must acquire SN25 to access network bandwidth

02

Miners paid SN25 on real usage

Network Operators grow, increasing demand for miners

03

Growth creates product flywheel

Economics attracts a better miner ecosystem and powerful network

a denser network attracts the next operator

The same UR miner fleet can scale NOs asymmetrically

The more SUM(users + data) driven by NOs, the more valuable the network

SN25 BOUGHT · 1× → 3× → N×

Same miner fleet can monetise idle supply

Multiple businesses ready to be built on UR

HOW EACH BUSINESS CONSUMES THE NETWORK

NETWORK DEPENDENCY: ● CRITICAL ○ HIGH

NETWORK FEE: $\text{MAU} \times \text{price/user} + \text{GB} \times \text{price/GB}$

SIX EXAMPLE STARTING BRIEFS

WEB2 COMP

01	White-label VPN	An incumbent's users, delivered at lower cost	MOZILLA VPN	2M subscribers
02	Encrypted business mail	Mail the provider itself cannot read	PROTON	\$134M revenue
03	The agent access layer	Attributable web access for autonomous agents	BROWSERBASE	\$300M valuation
04	AI answer visibility	Show brands how they appear inside AI answers	PROFOUND	\$1B valuation
05	Ad verification	Prove an ad ran where it was bought	DOUBLEVERIFY	~\$1.7B public
06	Private LLM search	An answer engine built for commercial intent	DUCKDUCKGO	\$200M revenue

Bittensor can scale UR from regional depth to global density, targeting 1B+ users

Open competition creates an incentive to deepen provider supply market

BEFORE

Deep in two regions

real density in the US and Southeast Asia, funded entirely by us

deep in the US and Southeast Asia, thin or absent across the rest of the world

~1M practical ceiling on monthly actives
before capacity per country runs out

AFTER

That depth, everywhere

the subnet pays for coverage, so density compounds market by market

the same depth in every market, including the ones that matter most

~1B addressable population once density
is no longer the binding constraint

Bandwidth is Bittensor's next major commodity

Peer-to-peer encryption
network

Enterprise and consumer privacy are multi-billion dollar markets

CONSUMER PRIVACY

\$134M revenue

Expanded from encrypted email into a broader privacy subscription suite

\$3B valuation

Built a global consumer security platform around VPN-led distribution

DuckDuckGo

\$200M revenue

Monetises private search without behavioural tracking or user profiles

ENTERPRISE PRIVACY

\$3.36B ARR · 25% YoY growth

Replaced perimeter VPN access with cloud-delivered zero trust

\$2.81B revenue · 30% YoY growth

Extended network infrastructure into enterprise security and private access

\$1.5B valuation

Turned developer-led mesh networking into enterprise demand
